The self-adhesive urinary sheath  
with the short adhesive zone

# Problems

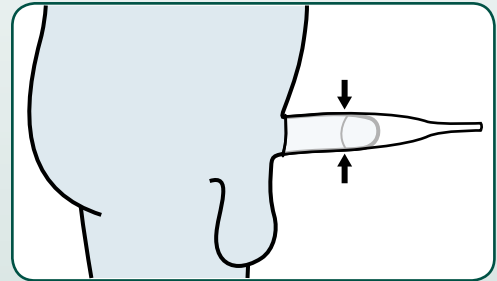

When using a urinary sheath, various problems may occur, which often also originate from the properties of the urinary sheath in question.

To counteract the problems listed below, a urinary sheath has to fulfil particular requirements.

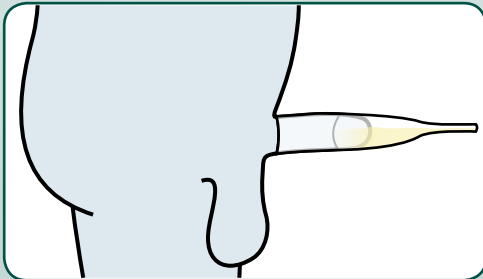

## Friction

Urinary sheaths without a flexible buffer zone may rub against the clothing, which may cause the urinary sheath to come loose untimely.

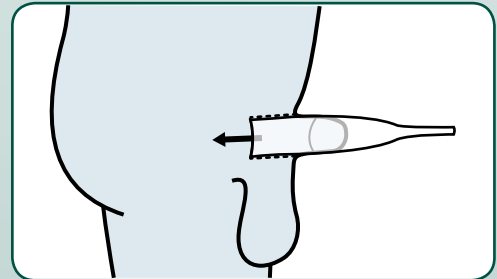

## Not the right size

Urinary sheaths that are not the right size usually don't allow for a safe adhesion to the skin.

## Formation of urine residues

With urinary sheaths made of a more rigid material often a residue of urine remains in the sheath.

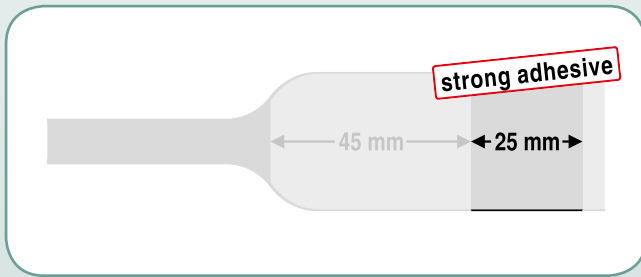

## Retracted penis

The penis withdraws in the abdominal cavity leaving only a small surface for adhesion.

# SAUER-Comfort – Violet

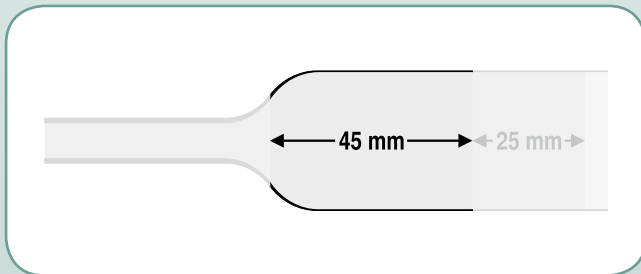

These urinary sheaths have been designed and are manufactured in our factory at Lobbach. They have the necessary characteristics to ensure a secure, reliable and simple handling in addition to a high wearing comfort. With the urinary sheath SAUER-Comfort – Violet the adhesive zone is sig-

nificantly shorter than with our other sheaths. This feature makes them particularly suitable for users with a smaller anatomy, but without large amounts of spontaneous urine. Because of its minor length, the smaller sizes of this sheath are also suitable for children.

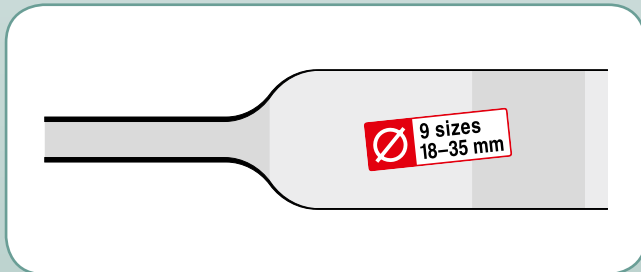

## Short adhesive zone

In case of a small surface available for adhesion, a short adhesive zone is an advantage, because no sticky ring remains at the upper end of the sheath, which might otherwise get stuck to the underwear. In compensation, the adhesive is stronger and ensures a safe adhesion. Within the adhesive zone, the urinary sheath is transparent making an assessment of the skin possible at any time without having to remove the sheath.

## Buffer zone

The sheath can be joined more closely to the body. This way, friction between the underwear and the sheath, which might otherwise cause the sheath to come off, is largely avoided. The tube between the sheath and the urine collection bag can be placed to the left or to the right side at will.

## 9 sizes

The finely graded sizes (diameter 18–35 mm) allow an exact fit. The better the fit, the safer the adhesive contact.

# SAUER-Comfort – self-adhesive urinary sheaths

The sheath and the adhesive are made of synthetic materials. The sheath and the connecting tube are manufactured as one piece. They can be connected to all urine collection bags with or without adapter. Available in 9 sizes.

30 pieces in one box, 1 protective cloth (matching the size of the sheath) is enclosed.

## Urinary Sheath – SAUER-Comfort – Violet

Length 75 mm, buffer zone 45 mm, adhesive zone 25 mm, strong adhesive
